INTRODUCTION

Description of Policy

This document is intended as a model coverage policy for proton beam therapy. This model coverage policy identifies under what clinical indications such therapy is appropriate to administer to patients. The use of proton beam therapy in patients with the indications delineated in the policy is supported by references to peer-reviewed, scientific literature. Finally, we have provided the ICD-9 and ICD-10 codes which may correlate to each of the indications to demonstrate those codes, or ranges of codes, that are appropriate for each clinical indication. The American Society for Radiation Oncology released a model policy for Proton Beam Therapy in May 2014. The ADCC, National Association for Proton Therapy, and PTCOG view ASTRO's model policy as further support of coverage of proton beam therapy.

Purpose of Policy

The purpose and intent of this policy is to streamline the process by which payers reimburse for proton beam therapy procedures. It is our hope that by providing this list of clinical indications where the use of proton beam therapy is supported by clinical literature, that payers will accept and adopt this model coverage policy as their own and use it as a guide for reimbursing proton beam therapy procedures. The hope is that this policy will serve as both an educational tool to the oncology community as a whole, regarding both the appropriate use of proton beam radiotherapy as well as demonstrate the potentially relevant ICD-9 and ICD-10 codes for those clinical indications.

Policy Disclaimers

While this model coverage policy for proton beam therapy is an excellent guide for clinicians and payers alike, it should not be used as a comprehensive tool. As technologies and best practices in our medical field change and evolve, so too will this model coverage policy. In addition, clinical decision-making regarding the appropriate application of proton beam therapy for a given patient should remain solely with the patient with guidance from the patient's treating physician. We acknowledge that the information provided in this document is focused on the typical patient's clinical indications and there will always be patients who present with indications or symptoms not captured within this model coverage policy. In those cases, it is our expectation that providers will adhere to literature-based guidelines and provide the payer with as much clinical information as possible to support the use of performing a proton beam therapy procedure in an atypical patient. This policy comprehends the proton beam radiotherapy delivery service itself and is not intended to cover the entire scope of services associated with proton beam therapy (i.e., treatment planning, simulation and imaging, contouring, radiation dose prescribing, dosimetric planning and calculations, and patient specific dose verification). These services may have separate coding and reporting requirements that are not addressed in this policy.

Indications and Limitations of Coverage and/or Medical Necessity

Proton Beam radiotherapy is a form of conformal external beam radiation treatment. Protons are positively charged subatomic particles which have similar biological effects to conventional x-ray beams. However, unlike x-rays, protons deposit their radiation energy at a depth in tissue which is dependent on the energy of the proton. The improvement in therapeutic ratio results from a lower entrance dose to normal organs beyond the tumor, the elimination of exit dose to organs and the ability to give a higher dose to the tumor target. Like other conformal radiation modalities, proton beams can be precisely delivered to the tumor volume without harming surrounding healthy tissue or critical organs. Proton beam therapy may be delivered through multiple techniques, including passive and active scanning, scattering, and “pencil beam”.

Indications

Proton beam therapy will be considered medically reasonable and necessary for the following conditions:

- Benign or malignant central nervous system tumors to include but not limited to primary and variant forms of astrocytoma, glioblastoma, medulloblastoma, acoustic neuroma, craniopharyngioma, benign and atypical meningiomas, pineal gland tumors, and arteriovenous malformations
- Intraocular melanomas
- Pituitary neoplasms
- Benign or malignant conditions of the base of the skull or axial skeleton including but not limited to chordomas and chondrosarcomas
- Malignant lesions of the head and neck
- Lung cancers, especially NSCLC
- Unresectable retroperitoneal sarcoma
- Solid tumors in children up to age 18
- Gastrointestinal tract tumors
- Urinary tract tumors
- Tumors of the female pelvic organs
- Prostate Carcinoma

In addition, proton beam therapy is indicated when:

- The Dose Volume Histogram (DVH) illustrates at least one (1) or more critical structures or organs that must be considered at risk in or adjacent to the treatment volume to be protected by the use of proton beam therapy;
- There is documented clinical rationale that doses generally thought to be above the level otherwise attainable with other radiation methods might improve control rates;
- Other radiation therapy treatment plans (e.g., photon-based treatment plans) would have a greater probability of causing clinically meaningful acute and late normal tissue toxicity;
- The proposed treatment volume or an immediately adjacent volume has been previously irradiated, and the dose must therefore be tightly conformed to avoid exceeding the

tolerance dose of nearby normal organs and tissues and proton therapy would result in less risk; or

- There is documented clinical rationale that the higher levels of precision associated with proton beam therapy compared to other radiation treatments are clinically necessary.

Other factors considered favorable for coverage for additional indications than those listed above include enrollment of the patient in a clinical trial or an appropriate clinical registry for planned assessment and publication. Any denials for indications not listed in this policy, can have medical documentation and adequate literature submitted in the appeals process for potential coverage.

Limitations

- Proton beam therapy is generally not indicated for cancers that are widely disseminated or have hematogenous metastases.
- For the treatment of primary lesions, the intent of treatment should be curative.
- For the treatment of recurrent or metastatic lesions, there should be the expectation at the time of treatment of a long-term benefit (greater than 12 months of life expectancy).

OTHER INFORMATION

Documentation Requirements

1. All documentation must be maintained in the patient's medical record and available to the contractor / payer upon request.
2. Every page of the record must be legible and include appropriate patient identification information (e.g., complete name, dates of service(s)). The record must include the physician or non-physician practitioner responsible for and providing the care of the patient.
3. The submitted medical record should support the use of the selected ICD-9 or ICD-10 code(s). The submitted CPT®/HCPCS code should describe the service performed.
4. Each claim must be submitted with ICD-9 or ICD-10 codes that reflect the condition of the patient, and indicate the reason(s) for which the service was performed. Claims submitted without ICD-9 or ICD-10 codes will be returned.
5. Documentation in the patient medical record must support:
 1. The reasonable and necessary requirements as outlined under the coverage and limitations sections of this policy and must be available to the contractor / payer for review upon request.
 2. Documentation must include the planned course of therapy, type and delivery of treatment, level of clinical management involved and ongoing documentation of any changes in the course of treatment, and DHV as noted in the covered indications section.
